## TABLE OF CONTENTS

Table of Contents .....	2
1. Preface.....	3
2. General Logic Board Features .....	3
3. Part Number Configuration .....	3
4. Standard Part Numbers .....	4
5. Connectors .....	4
6. Board Dimensions.....	6
7. Schematics.....	7
8. Key Terms & Definitions.....	8

## 1. Preface

The OLED 64x48 logic boards are used for mounting OLED 64x48 SmartSwitches or 52x36 SmartDisplays into panels and system assemblies. The 2 switch versions are also used in the SmartSwitch Dev Kits as demonstration platforms for the SmartSwitch and SmartDisplays. This user manual will go through general features. The NKK Switches' SmartSwitch web site is <http://www.nkkswitches.com/smartswitch/>.

## 2. General Logic Control Features

The OLED 64x48 logic boards are PCB's that have mount positions for one or more OLED 64x48 SmartSwitches or 52x36 SmartDisplays. The switches/displays can be mounted directly on the logic board or on a socket mounted on the board. One or two switch boards are the most common but logic boards with other configurations are available as well as custom designs. They have some "glue logic" for converting the select lines and switch scanning to serial, and therefore many logic boards can be daisy-chained via 14-pin ribbon cables. The switch numbering is according to their order in the daisy-chain, where the switch number one is on the logic board connected directly to the controller.

There are two types of OLED 64x48 logic boards; RGB pushbutton and RGB display.

## 3. Part Number Configuration

The logic board part numbers are divided up by their attributes.

1                      2                      3  
IS   -   L02L1   -   C

1. IS Prefix.
2. The Logic Board base part number. The first number is the quantity of switch positions on the board. The second number is the version.
3. No code = No socket for IS switches.  
C = Sockets are soldered to the PCB for IS switches.

**Logic boards can be customized based on customer requirements.**

## 4. Standard Part Numbers

One or two switch boards are the most common but logic boards with other configurations are available as well as custom designs. NKK Switches will work with customers to design and build custom logic boards to fit customer requirements.

**Part number examples used in IS Dev Kits:**

SmartSwitch Configuration	Part Number	Description
Two OLED 64x48 RGB Pushbutton	IS-L02L1-C	With socket

## 5. Connectors

The SmartSwitch Controller connects to the J1 of the first logic board via 14 pin ribbon cables. The J2 of the first logic board connect to J1 of the second logic board and so on.

**Note: Attaching the ribbon cable without the red line on pin 1 on each of the headers may cause damage to the controller or the logic board.**

**The logic boards have two connectors:**

**J1 Input port:** 7x2 male header .1"x.1" spacing.

This connector connects to the controller port or J2 of the previous logic board in the daisy chain.

Pin	Function	
1	RES	Reset
2	GND	Ground
3	DIN	Din of all SmartSwitches
4	GND	Ground
5	SCK	SCK of all SmartSwitches
6	oe	Driver Output Enable. Can be connected to gnd.
7	VCC	3.3V Supply
8	V16	16V Supply
9	DC	Data Command
10	Pen	NC
11	CLKss	Clock for all shift registers
12	DATAss	Din of the first shift register
13	LPss	Latch all shift register outputs to the all drivers
14	SWRD	Switch Read bus for all SmartSwitches

**J2 Output port:** 7x2 male header .1"x.1" spacing.

This connector connects to J1 of the next logic board in the daisy chain.

Pin	Function	
1	RES	Connected to J1
2	GND	Connected to J1
3	DIN	Connected to J1
4	GND	Connected to J1
5	SCK	Connected to J1
6	oe	Connected to J1
7	VCC	Connected to J1
8	V16	Connected to J1
9	DC	Connected to J1
10	Pen	Connected to J1
11	CLKss	Connected to J1
12	DATAss	Connected to Dout of the last shift register
13	LPss	Connected to J1
14	SWRD	Connected to J1

## 6. Board Dimensions

Logic Board Dimensions for IS-L02L1:

Dimension A	Socket	Compact	Both
	0.154	0.905	1.059

## 7. Schematics

Schematic for IS-L02L1 Rev C:

## 8. Key Terms & Definitions

<b>OLED Module</b>	NKK Switches' OLED SmartSwitches and SmartDisplays.
<b>Host</b>	Any computer, terminal, or other device that can communicate over the USB line.
<b>Controller</b>	A PCB assembly that controls one or more logic boards and the switches associated with them. It communicates with a host over the USB line.
<b>Logic Board</b>	A PCB assembly with “glue logic” for mounting switches. It is controlled by a controller.
<b>Byte</b>	An eight-bit hex value ranging from 00H to FFH (Decimal 0 to 255). The bit format of a byte is: (B7 B6 B5 B4 B3 B2 B1 B0) where B7 is most significant and bit B0 is least significant bit.
<b>Nibble/Hex digit</b>	A four-bit value ranging from 0H to FH. A byte consists of two nibbles.
<b>ASCII</b>	A byte value representing a symbol.
<b>Communication Format</b>	<p>There are two formats to transmit a byte:</p> <ol style="list-style-type: none"> <li><b>Hex format</b> - A hex byte is transmitted without any change to it. [xxH] will be used to denote this.  All commands and some data are sent by using this format.</li> <li><b>ASCII HEX format</b> - Each nibble of the byte is converted to ASCII code and sent as a byte. [xxAH] will be used to denote this.  For example, the hex byte 5AH is transmitted in two bytes, <b>35H</b> and <b>41H</b>. The ASCII value for <b>5</b> is <b>35H</b> and the ASCII value for <b>A</b> is <b>41H</b>.  All addresses and most data are sent using this format.</li> </ol>
<b>Address</b>	A two-byte value ranging from 0001H to FFFFH representing the 65536 memory locations for pictures and attributes on microSD flash.
